Design and implement a homomorphic filtering technique using MATLAB to enhance the contrast of low-light images. Evaluate the effectiveness of your implementation by applying it to a variety of images with different lighting conditions.

CODE:

```
clc;
close all;
clear all;

d = 10; % Cutoff frequency
d2 = d^2; % Square of cutoff frequency

f = double(rgb2gray(imread("C:\Users\dsplab\OneDrive\Documents\Desktop\IMG20240307-
WA0067.jpg")));

% f = f - 90;

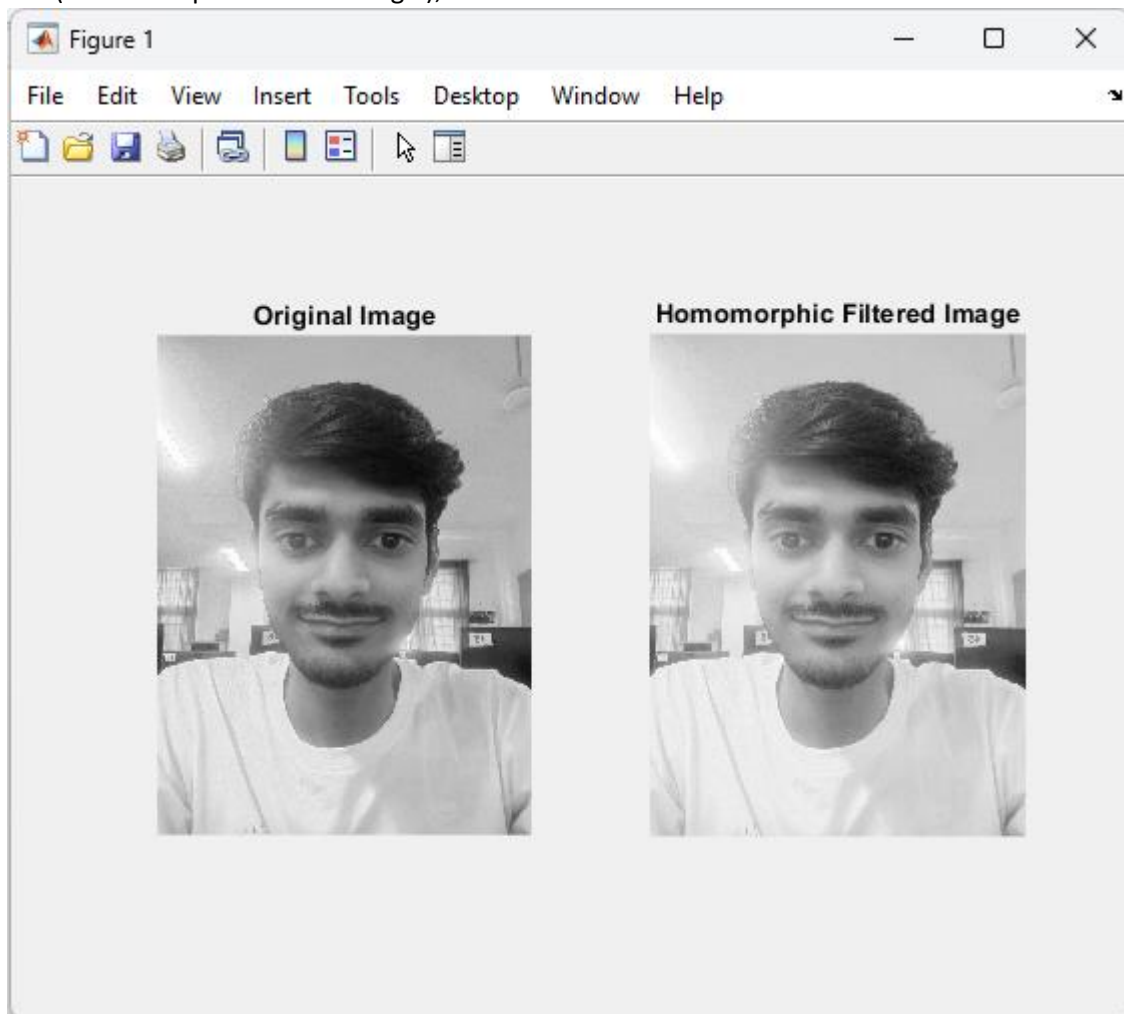

% f = max(min(f, 255), 0);

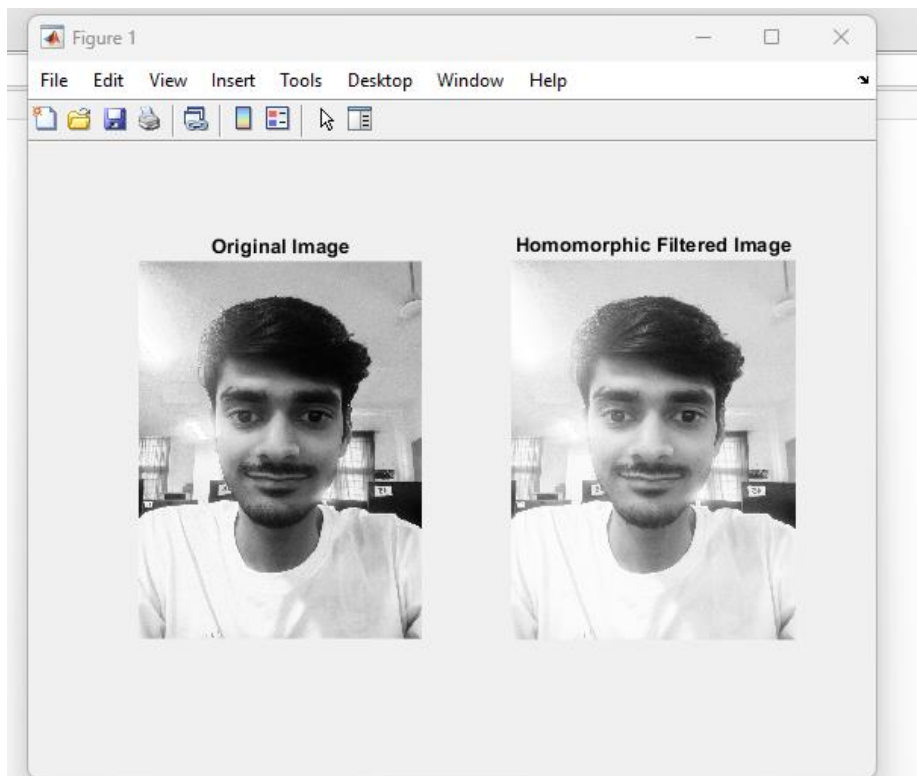

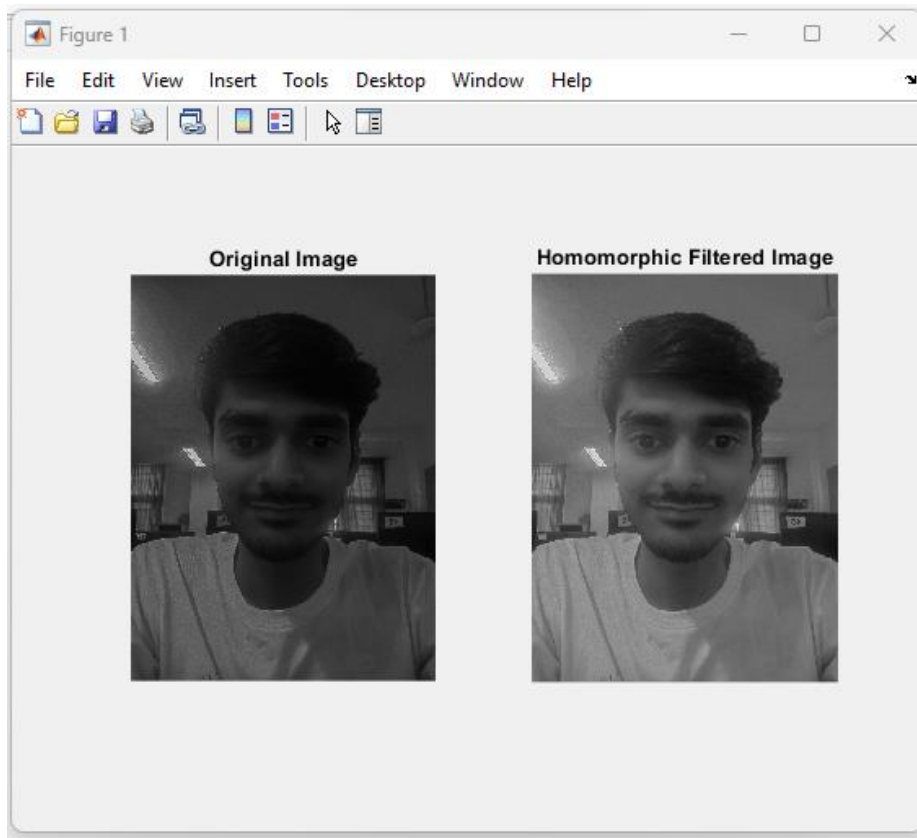

l = log(1 + f); % Logarithmic transformation
z = fft2(l);

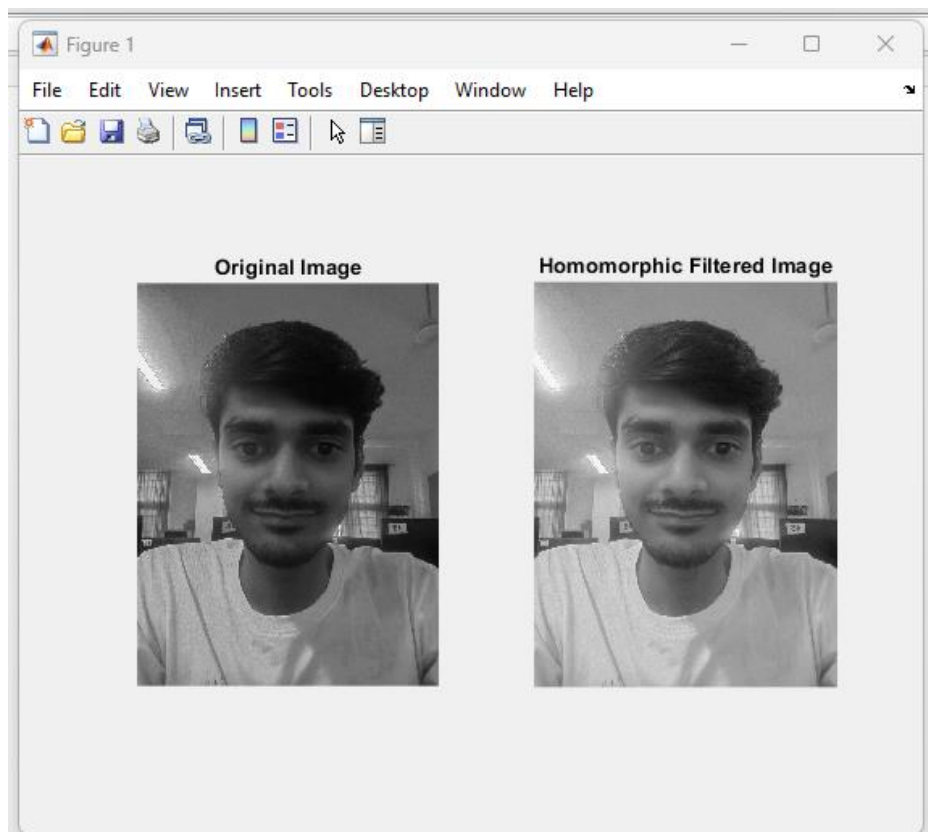

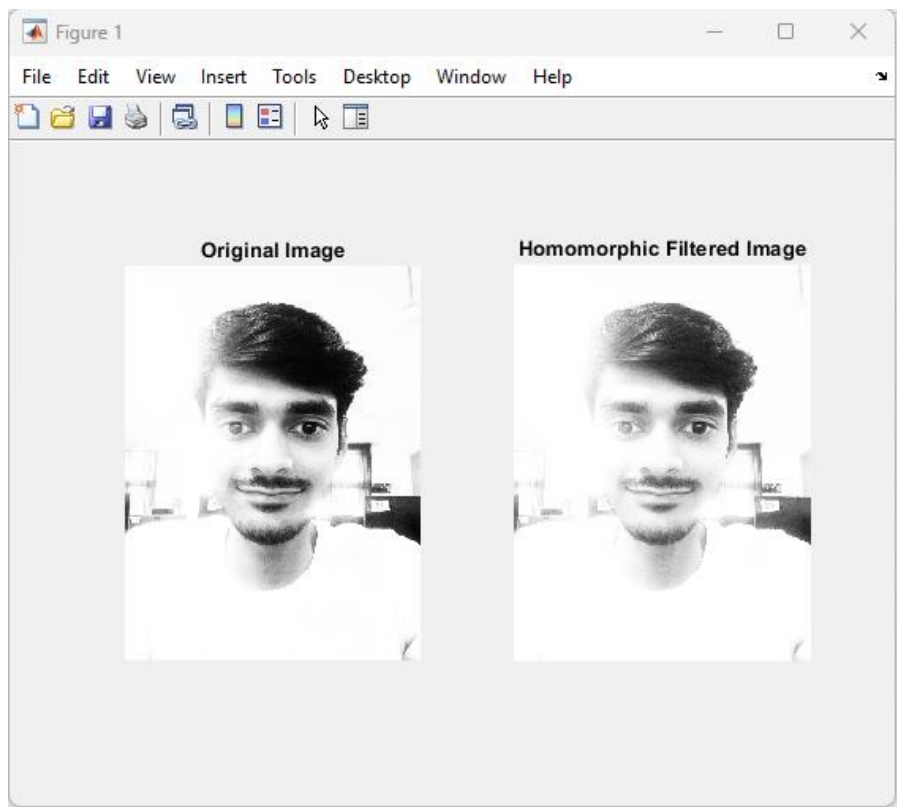

[m, n] = size(f);
b = zeros(m, n);
h = zeros(m, n);

for i = 1:m
    for j = 1:n
        b(i, j) = sqrt((i - m / 2)^2 + (j - n / 2)^2); % euclidian distance
        h(i, j) = exp(-b(i, j)^2 / (2 * d2)); % Gaussian filter
    end
end
```

```
L = 0.5; % Gamma low value
H = 1.5; % Gamma high value
filter = L + (H - L) * h;
s = z .* filter;
g = abs(iff2(s)); % inverse fourier transformation
e = exp(g) - 1; % inverse the logarithmic transformation
subplot(1, 2, 1);
imshow(f, []);
title('Original Image');
subplot(1, 2, 2);
imshow(e, []);
title('Homomorphic Filtered Image');
```

**CONCLUSION:-**This project successfully designed and implemented a homomorphic filtering technique using MATLAB
